

Audio Transcription

**Quick Short
Project**

FlutterFlow

OpenAI API

Project Four

Audio Transcription project is a utility tool built with  FlutterFlow and powered by the  OpenAI Transcription API

Its purpose is to provide immediate and accurate text transcription by converting uploaded audio files (like voice notes or interviews) into clean, readable text, demonstrating simple integration of low-code UI and advanced speech processing

1.

Context and Overview

The AI Voice Transcription Assistant is a real-time utility tool that accurately converts spoken audio into text instantly. It integrates

 **FlutterFlow** (low-code UI) with the

 **OpenAI Transcription API** (supporting formats like mp3, wav, and webm). Users simply upload an audio file and immediately receive a clean, readable text output, showcasing seamless low-code integration for voice-to-text solutions.

2.

Inside the OpenAI documentation

Audio Models Overview (Short Explanations)

- ◆ **Build Voice Agents** : AI systems capable of listening, speaking, and responding in real time using natural voice interaction.
- ▲ **Transcribe Audio**: Converts spoken audio into written text with high accuracy. Useful for subtitles, meeting notes, or voice-to-text applications.
- **Speak Text** :Generates natural-sounding speech from any written text.

API Types (Short Explanations)

Real-Time API

Allows bi-directional audio streams for live conversations (voice agents, assistants, etc.).

Speech API

Converts text back into audio (text-to-speech), enabling "speaking" agents

Transcription API

Used to convert audio files into clean, readable text. This is the API used in this project.

Chat Completion API

Traditional text-based interaction. Useful for turning transcriptions into structured answers, summaries, etc.

Norms & Formats

- **Audio inputs**: mp3, mp4, mpeg, mpga, wav, webm
- **Outputs**: plain text, JSON, SRT (subtitles), VTT (captions)

This is ideal for:

- Voice notes
- Interviews
- Class recordings
- Short audio questions
- Transcribing user messages inside apps

3. Creating the Project and API Keys

In the OpenAI dashboard

Create the project named

Image Generator

A Adriano / Image Generator

+ Create project

Image Generator

Generate an API Key

API keys

Don't Share your API Key

| NAME | STATUS | SECRET KEY | CREATED | LAST USED |
|-------------------------|--------|------------|-------------------|-----------|
| API_KEY_IMAGE_GENERATOR | Active | sk-...h4IA | 2 de dez. de 2025 | Never |

Store the key securely (Flutterflow → variables)

Variables

Name

Type

Is List

API_KEY_IMAGE_GENERATOR

String

False

4.

Applying the Project “Audio Transcription” in

FlutterFlow

Container

Title: **Audio Transcription**

Text

Audio Transcription

Button

Send_Audio

Send Audio

Send_Audio

txt_answer

Answer

txt_answer

The transcribed text will be displayed here

Preview

HomePage

Audio Transcription

Send Audio

The transcribed text will be displayed here

5.

Creating the API Call In FlutterFlow

API Calls + Add

New API Call

Audio Trasncription Synced

main Production

Name: "Audio Transcription Call"

Set as POST

Audio Transcription Call

api.openai.com/v1/audio/transcrip...

POST

Add headers:

- Content-Type: multipart/form-data
- Authorization: Bearer [API_KEY_Audio_Transcription]

Headers

Content-Type: multipart/form-data

Authorization: Bearer [API_KEY_Audio_Transcription]

Create variables

Variables

| Name | Type | Is List |
|-----------------------------|---------------|---------|
| API_KEY_Audio_Transcription | String | False |
| variable_file | Uploaded File | False |

- API_KEY_Audio_Transcription → string
- PROMPT → Uploaded File (input from user)

In Multipart Body, add:

the OpenAI API doc

Speech to text

Quickstart

Body

Multipart

```
curl --request POST \
--url https://api.openai.com/v1/audio/transcriptions \
--header "Authorization: Bearer $OPENAI_API_KEY" \
--header 'Content-Type: multipart/form-data' \
--form file=@/path/to/file/audio.mp3 \
--form model=gpt-4o-transcribe
```

| Name | Value Source | Select Variable | Type | Value |
|-------|----------------|-----------------|--------|-----------|
| file | From Variable | variable_file | | |
| model | Specific Value | | String | whisper-1 |

- **Multipart Body:** The API Body is set to Multipart, which is the required format for transmitting binary files (like audio) instead of standard JSON text.
- **Key Parameters:** It defines two essential fields: file (linked to variable_file) to pass the dynamic audio content, and model (set as a specific String) to specify the AI engine.

6. Applying the Image Generator API Inside the App

In the "Send Audio" button:

Add Action → API Call

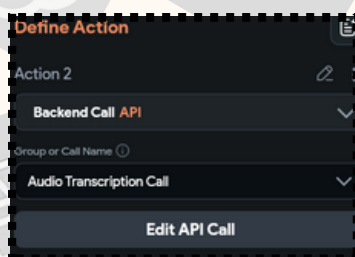

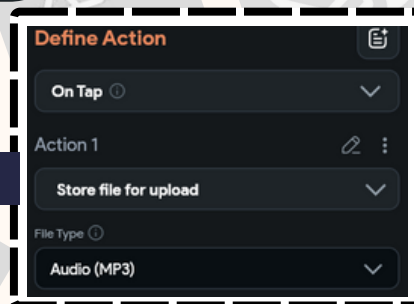

On Tap
3 actions

Define Action → Action 1 →

Upload Data > Upload/Save File

File Type → Audio (MP3)

On Success → Show Snackbar "Successful Request"

Action 2
Show Snack Bar

Value
Successful Request

On Error → Show Snackbar "Error Detected"

Action 3
Show Snack Bar

Value
Error

On the answer container:

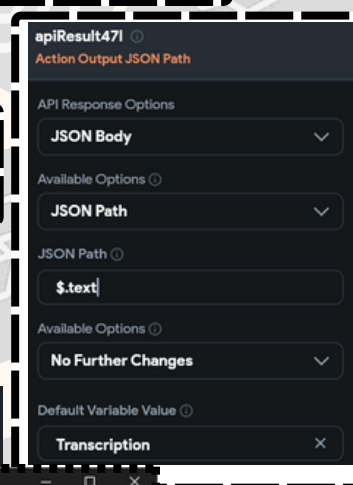

- Set the text to show the API variable "Result"

Testing

Send Audio File

Audio Transcription

Send Audio

Hello my name is Adriano and this is a test

7. Conclusion

The Audio Transcription project demonstrates how to

- Use the OpenAI Speech API to convert audio into text
- Upload audio files directly from Flutterflow
- Handle API responses and display transcriptions in a clean interface
- Understand the broader audio ecosystem including real-time, speech, and transcription capabilities

The Audio Transcription Project is a practical, fully functional example of how low-code development (FlutterFlow) + advanced AI (OpenAI Speech API) instantly unlocks the ability to convert spoken audio into accurate text without managing complex backend infrastructure, making sophisticated voice-to-text applications—for interviews, notes, or commands—accessible to anyone in minutes.
